$5.5 \mathrm{~V}, 6 \mathrm{~A}, 23 \mathrm{~m} \Omega$
AME6204
Single Channel Load Switch

## General Description

The AME6204 is a small, low $R_{\mathrm{ON}}$, single-channel load switch with enable function. The device contains a N -channel MOSFETs that can operate over an input voltage range of 0.8 V to 5.5 V and can offer a maximum continuous current of 6A

The EN pin is controlled by an on and off input, which can be driven directly by low-voltage control signals. In AME6204, a $225 \Omega$ on-chip load resistor is added for quick-output discharge when AME6204 is turned off. It's available in a small, space-saving DFN-8D ( $2 \times 2 \times$ 0.75 mm ) package with thermal pad allowing for high power dissipation.

## Features

- Input Voltage Range: 0.8 V to 5.5 V
- Bias Voltage Supports: 2.5 V to 5.5 V
- Integrated Single-Channel Load Switch
- 6A Maximum Continuous Current
- Ultra low $\mathrm{R}_{\mathrm{DS}(\mathrm{ON})} 23 \mathrm{~m} \Omega$
- Low Quiescent Current $(46 \mu \mathrm{~A})$
- Thermal Protection
- Adjustable Rise Time
- Quick Output Discharge (QOD)
- DFN-8D ( $2 \times 2 \times 0.75 \mathrm{~mm}$ ) Package with Thermal Pad
- RoHS Compliant

## Application

- Ultrabook, Notebooks and Netbooks
- Tablet PCs
- Consumer Electronics
- Set-top Boxes and Residential Gateways
- Telecom Systems
- Solid-State Drives (SSD)

## ■ Pin Description

| Pin Name | Pin No. | I/O | Description |
| :---: | :---: | :---: | :--- |
| IN | 1,2 | I | Power-switch input. 0.8V to BIAS voltage range for optimal $\mathrm{R}_{\mathrm{DS}(\mathrm{ON})}$ is <br> recommended. Place an optional decoupling capacitor between this pin <br> and GND for reduce input voltage dip during turn on. |
| EN | 3 | I | ON/OFF control input. Active high is turn-on. Do not leave it floating. |
| BIAS | 4 | I | Bias voltage input. Recommend voltage range (2.5V to 5.5V) to supply <br> the device. |
| GND | 5 | - | Ground |
| CT | 6 | I | Power-switch slew-rate control. Capacitor must be rated for a minimum of <br> 25V for desired rise time performance. This pin can be left floating. |
| OUT | 7,8 | O | Power-switch output. |

## $5.5 \mathrm{~V}, 6 \mathrm{~A}, 23 \mathrm{~m} \Omega$ <br> Single Channel Load Switch

## - Application Information

## Input Capacitor (Optional)

Place a $1 \mu \mathrm{~F}$ ceramic capacitor, $\mathrm{C}_{\mathrm{IN}}$ between IN and GND as close as possible to the pins to limit the voltage drop on the input supply caused by inrush current when the power switch turns on into a discharged load capacitor. Recommend to adopt an input capacitance about 10 times higher than output one to prevent from excessive voltage drop when switching heavy load.

## Output Capacitor (Optional)

Because of the body diode in NMOS, it is recommended to use a $C_{I N}$ greater than $C_{L}$. If a $C_{L}$ is greater than $\mathrm{C}_{\mathbb{I N}}$, it will cause $\mathrm{V}_{\text {OUt }}$ to exceed $\mathrm{V}_{\mathbb{I N}}$ while the system supply is removed. This could result in current flow through the body diode from $\mathrm{V}_{\text {Out }}$ to $\mathrm{V}_{\text {IN }}$. $A C_{I N}: C_{L}=10: 1$ is recommended for minimizing $V_{I N}$ dip caused by inrush currents during startup, however a 10:1 ratio for capacitance is not required for proper functionality of the device. If a ratio is smaller than 10 (such as 1), it will cause slightly more $\mathrm{V}_{\mathbb{I N}}$ dip upon turn on due to inrush currents. This can be mitigated by increasing the capacitance on the $\mathrm{C}_{\mathrm{T}}$ pin for a longer rise time (see the Adjustable Rise Time section).

## ON and OFF Control

The EN pins control the state of AME6204. Asserting EN pin high activates the switch. EN pin is active-high with a low threshold, making it capable of interfacing with low-voltage signals. The EN pin can be applied by standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. Do
not make the pin floating and must be tied either high or low for proper functionality.

## Quick Output Discharge (QOD)

When AME6204 is disabled, an internal discharge resistance is automatically connected between OUT and GND, thus discharge the remaining charge from the output. This resistance prevents the output from floating while the switch is disabled. For best results, it is recommended that AME6204 gets disabled before $\mathrm{V}_{\text {BIAS }}$ falls below the minimum recommended voltage.

Device Functional Modes

| EN | IN to OUT | OUT to GND |
| :---: | :---: | :---: |
| $H$ | ON | OFF |
| $L$ | OFF | ON |

## Power Dissipation

The maximum IC junction temperature must be restricted to $125^{\circ} \mathrm{C}$ under normal operating conditions. To calculate the maximum allowable power dissipation

$$
\mathrm{P}_{\mathrm{D}(\max )}=\frac{\mathrm{T}_{\mathrm{J}(\max )}-\mathrm{T}_{\mathrm{A}}}{\theta_{\mathrm{JA}}}
$$

where

- $P_{D(\max )}$ is the maximum allowable power dissipation.
- $T_{J(\max )}$ is the maximum allowable junction temperature.
- $T_{A}$ is the ambient temperature of the device.
- $\theta_{\mathrm{JA}}$ is the junction to air thermal impedance. This parameter is highly dependent upon board layout.
$5.5 \mathrm{~V}, 6 \mathrm{~A}, 23 \mathrm{~m} \Omega$
AME6204 Single Channel Load Switch

## Application Information (Contd.)

## $\mathrm{V}_{\mathrm{IN}}$ and $\mathrm{V}_{\text {BIAS }}$ Voltage Range

For optimal $R_{\text {ON }}$ performance, make sure $\mathrm{V}_{\mathbb{I N}} \leq \mathrm{V}_{\text {BIAS }}$. The device will still be functional if $\mathrm{V}_{\text {IN }}>\mathrm{V}_{\text {BIAS }}$ but it will exhibit $R_{\text {ON }}$ greater than what is shown in the Characterization Curve " $V_{\text {IN }}$ v.s $R_{\text {ON" }}$.

## Adjustable Rise Time

Place a capacitor between CT pin and GND to set the rise time of OUT pin. To ensure desired performance, a capacitor with a minimum voltage rating of 25 V must be applied on either CT pins. An approximate formula for the relationship between CT and rise time is (Equation accounts for $10 \%$ to $90 \%$ measurement on $\mathrm{V}_{\text {out }}$ ):

Rise Time $(\mu \mathrm{S})=\left(\mathrm{C}_{\mathrm{T}}+39\right) * \mathrm{~V}_{\text {OUT }} * 0.36+21$
where $\mathrm{C}_{\mathrm{T}}$ is the capacitance value on the CT pin (in pF)
Rise time values measured on a typical device is shown as Table 1. Rise times shown below are only valid for the power-up sequence where IN and BIAS are already in steady state condition, and the EN pin is asserted high

Table 1. Rise Times on a typical device

| $\mathrm{C}_{\mathrm{T}}(\mathrm{pF})$ | Rise Time ( $\mu \mathrm{s}$ ) $10 \% \sim 90 \%, \mathrm{C}_{\mathrm{L}}=0.1 \mu \mathrm{~F}, \mathrm{C}_{\mathrm{IN}}=1 \mu \mathrm{~F}, \mathrm{R}_{\mathrm{L}}=10 \Omega^{(1)}$ |  |  |  |  |  |  |
