

AME8755

■ General Description

The AME8755 is highly accurate, dual channel, high PSRR, low quiescent current CMOS LDO. The AME8755 includes a reference voltage source, error amplifiers, over current limit and thermal shutdown and consumes only 70 μ A (typical) quiescent current at no load with both channels enabled. The EN function allows the output of each channel to be turned on and off independently.

■ Typical Application

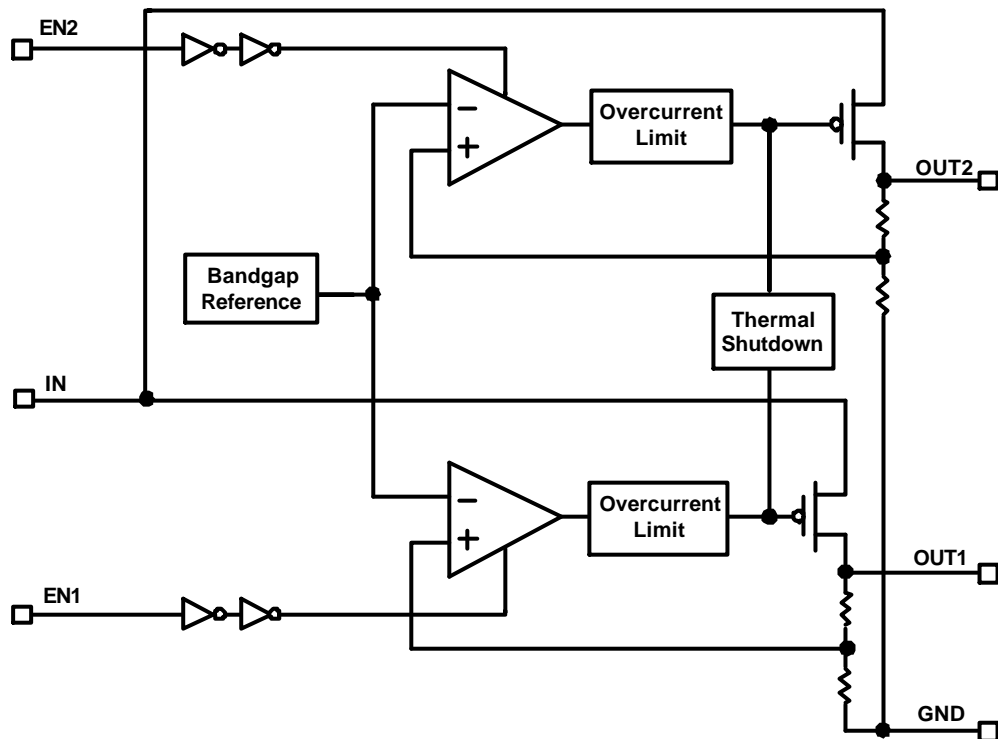

■ Features

- Guaranteed 150mA Output
- Accurate to within $\pm 2\%$
- 1.2V to 3.3V Factory-Preset Output
- Over Current Protection
- Over Temperature Shutdown
- High PSRR (Typ. 70dB)
- Low Quiescent Current (Typ. 70 μ A)
- Green Products Meet RoHS Standards

■ Applications

- Mobile Phones
- Digital Cameras
- PDAs
- Wireless LAN Applications

■ Pin Description

Pin Name	Pin Description
OUT1	LDO voltage regulator output pin. It should be decoupled with a 1 μ F or greater value low ESR ceramic capacitor.
IN	Input voltage pin. It should be decoupled with 1 μ F or greater capacitor.
OUT2	LDO voltage regulator output pin. It should be decoupled with a 1 μ F or greater value low ESR ceramic capacitor.
EN2	Enable pin. When pulled low, the PMOS pass transistor turns off OUT2, current consuming less than 1 μ A.
GND	Ground connection pin.
EN1	Enable pin. When pulled low, the PMOS pass transistor turns off OUT1, current consuming less than 1 μ A.

AME8755

High PSRR, Low Quiescent Current, 150mA Dual CMOS LDO

■ Detailed Description

The AME8755 contains two PMOS pass transistors, a reference voltage source, error amplifiers, over current protection, and thermal shutdown. The P-channel pass transistor receives data from the error amplifier, over current limit, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference. The output voltages are controlled and stabilized by a system of negative feedback.

The AME8755 requires an output capacitor connected between the output and ground to stabilize the internal control loops. The minimum recommended output capacitor is 1 μ F. The IC's internal circuitry can be turned on and off via the signal from the EN1 and EN2 pins, for example: OUT1 is turned on when EN1 is greater than 1.4V. And OUT1 is turned off when EN1 is less than 0.4V, resulting in greatly reduced power consumption, same operation for EN2 and OUT2.

The AME8755's over current limit and thermal shutdown protection prevent the IC from damaging. The internal over current protection helps protect the regulator during fault conditions. During over current protection, the output will be pulled down and source a nearly fixed amount of current that is largely independent of the output voltage. Thermal shutdown protection disables both outputs when the junction temperature of either channel rises to approximately 160°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. This limits the dissipation of the regulator, protecting it from damage due to over heating.
