

■ General Description

The AME8867 device is a low dropout linear regulator designed for up to 36V input voltage operations. With only $1.5\mu\text{A}$ (typical) quiescent current at light load, the device is suitable for standby micro-control unit systems, especially in continuous standby applications such as notebook, networking, industrial products and battery powered equipment.

The devices feature an integrated short-circuit and over current protection.

The AME8867 device is available in SOT-23, SOT-25, SOT-89, SOT-223 and SOP-8/PP packages.

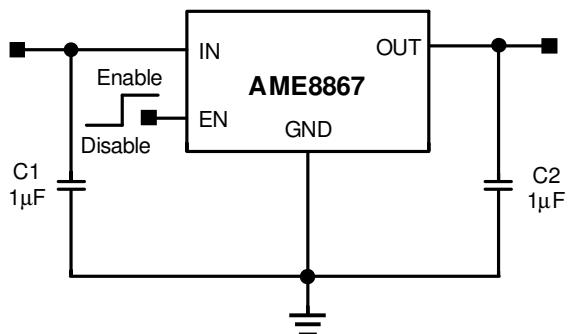

■ Features

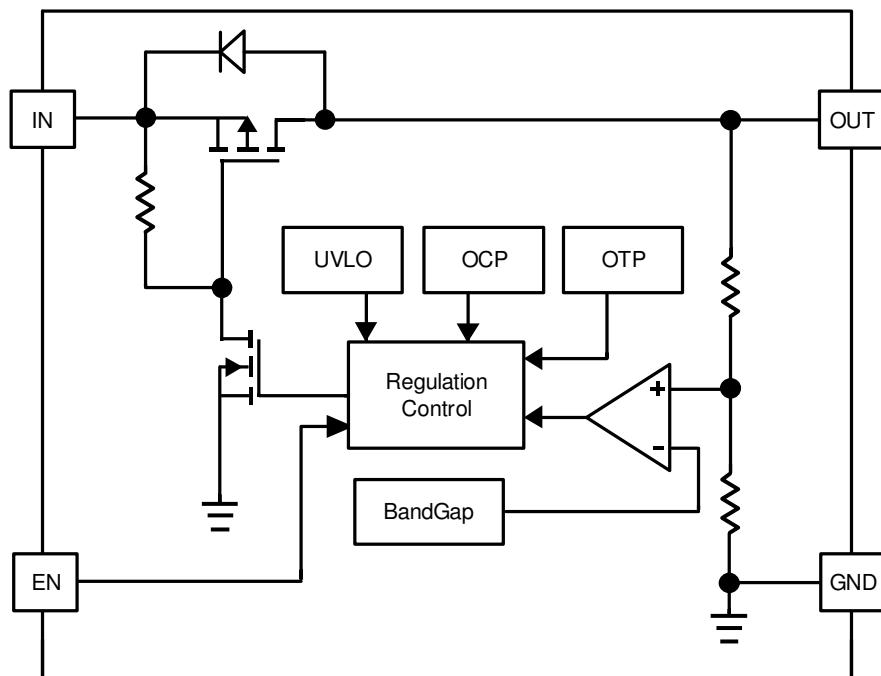

- 4.75V to 36V Wide Input Voltage Range
- Output Voltage Tolerance: $\pm 2\%$
- Maximum Output Current: 250mA
- Ultra Low Quiescent Current: $1.5\mu\text{A}$ (typical)
- 1.2V Typical Low Dropout Voltage at 250mA Load Current
- Internal Over Temperature Protection
- Internal Over Current Protection
- Stable With Low ESR Ceramic Output Capacitor

■ Applications

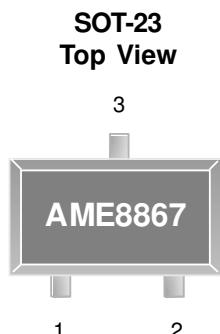

- Keep-Alive Supply in Notebook and Portable Computers
- Always-On Battery Application
- USB Power Supply
- Ultra Low Power Microcontrollers

■ Typical Application

■ Absolute Maximum Ratings

Parameter	Maximum	Unit
Input Voltage	-0.3 to +45	V
Junction Temperature	125	
Storage Temperature	-65 to +150	°C
Lead Temperature (Soldering, 10sec.)	300	

Note: (1)Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to other conditions beyond those indicated under "recommended operation conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

(2)All voltage values are with respect to the GND terminal.

(3)Absolute negative voltage on these pins must not go below -0.3V.

■ Recommended Operating Conditions

Parameter	Symbol	Rating	Unit
Input Voltage	V_{IN}	4.75 to 36	V
Junction Temperature Range	T_J	-40 to +125	°C

Note: Refer to typical application circuit.

■ Electrical Specifications

$V_{IN} = V_{OUT} + 2V$, $I_{OUT} = 1\text{mA}$, $C_{IN} = C_{OUT} = 1.0\mu\text{F}$, $T_J = 25^\circ\text{C}$, unless otherwise specified.

Parameter	Symbol	Test Condition	Min	Typ	Max	Units
Input Voltage	V_{IN}		4.75		36	V
DC Output Accuracy	V_{OUT}		-2%		2%	V
Line Regulation	ΔV_{LINE}	$V_{IN} = V_{OUT} + 1.5V$ to 36V		2	12	mV
Load Regulation	ΔV_{LOAD}	$I_{OUT} = 1\text{mA}$ to 100mA		0.5	1	%
		$I_{OUT} = 1\text{mA}$ to 250mA		1	2	
Dropout Voltage (Note1)	V_{DROP}	$I_{OUT} = 100\text{mA}$		400	720	mV
		$I_{OUT} = 250\text{mA}$		1200	2000	
Enable High Level	V_{ENHI}	IC is enabled	0.9		V_{IN} (Note2)	V
Enable Low Level	V_{ENLO}	IC is shutdown	0		0.4	V
Quiescent Current	I_Q			1.5	2.5	μA
Enable pin Pull High Current	I_{EN}			0.3	1	μA
Current Limit	I_{CL}		270	370		mA
Output Voltage PSRR	PSRR	$f = 100\text{Hz}, C_{OUT} = 1\mu\text{F}, I_{OUT} = 10\text{mA}$		60		dB
		$f = 1\text{KHz}, C_{OUT} = 1\mu\text{F}, I_{OUT} = 100\text{mA}$		60		
Over Temperature Shutdown	OTS			140		$^\circ\text{C}$
Over Temperature Hysteresis	OTH			20		$^\circ\text{C}$

Note:

(1) Dropout Voltage is measured at $V_{OUT} = V_{OUT(NOM)} \times 98\%$

(2) V_{EN} must be $\leq V_{IN}$

■ Detailed Description

The AME8867 family of CMOS regulator contain a PMOS pass transistor, voltage reference, error amplifier, over-current protection thermal shutdown and Power Good detection circuitry.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference.

Capacitor Selection and Regulator Stability

The AME8867 is stable with an output capacitor to ground of $1\mu F$ or greater. Ceramic capacitors have the lowest ESR and will offer the best AC performance. Conversely, Aluminum Electrolytic capacitor exhibit the highest ESR, resulting in the poorest AC response. Unfortunately, large value ceramic capacitors are comparatively expensive. One option is to parallel a $0.1\mu F$ ceramic capacitor with a $10\mu F$ Aluminum Electrolytic. The benefit is low ESR, high capacitance and low overall cost.

A second capacitor is recommended between the input and ground to stabilize V_{IN} . The input capacitor should be at least $0.1\mu F$ to have a beneficial effect.

Enable Pin

The Enable Pin is Active High. When activated pulled low, the MOS pass transistor shuts off and all internal circuits are powered down. In this state, the standby current is less than $1\mu A$.

This pin can not be floating. V_{EN} must be $\leq V_{IN}$.

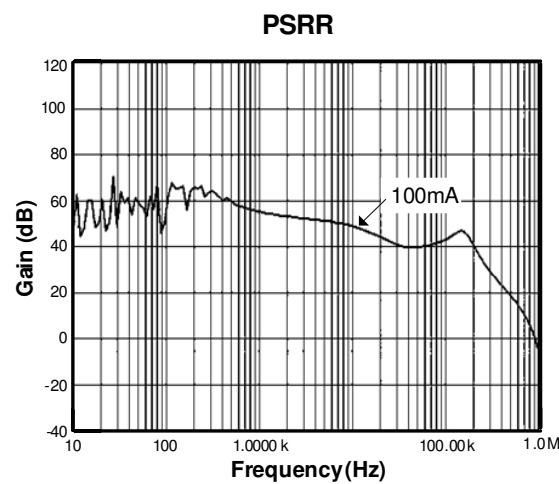

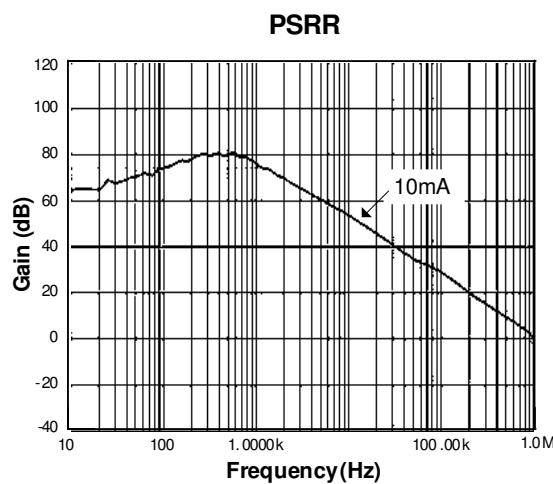

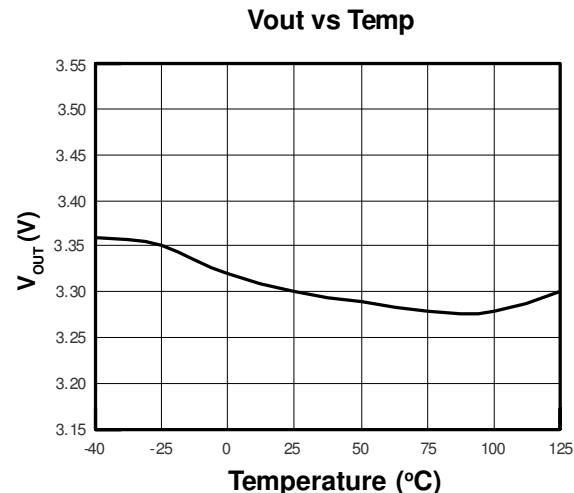

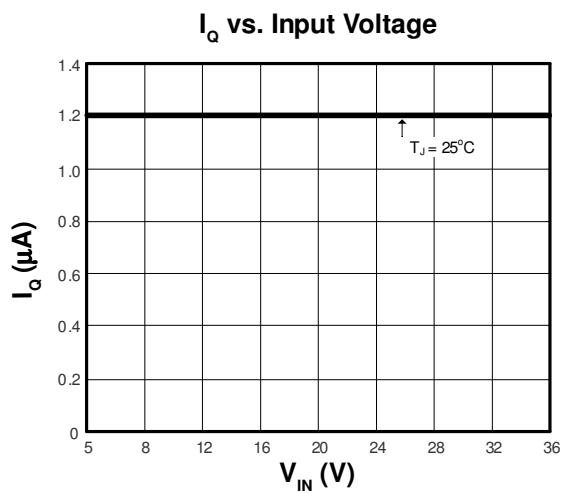

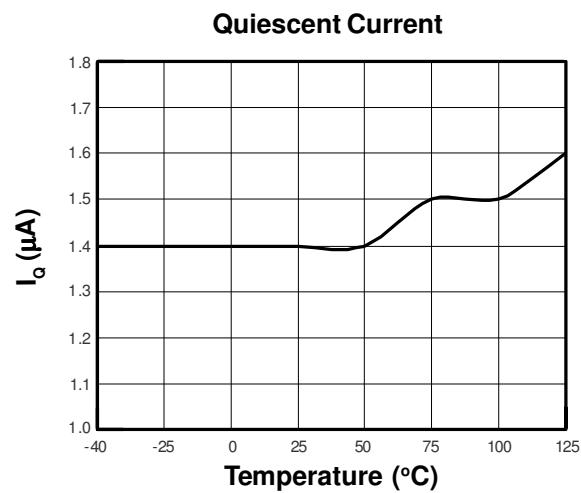

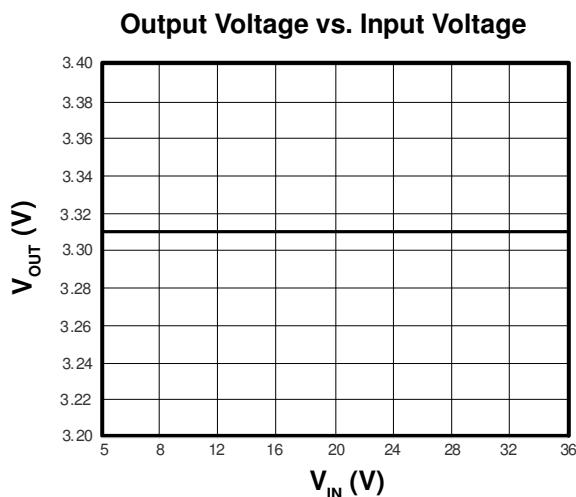

The maximum output power of the AME8867 is limited by the maximum power dissipation of the package. By calculation the power dissipation of the package as a function of the input voltage, output voltage and output current, the maximum input voltage can be obtained. The maximum power dissipation should not exceed the package's maximum power rating.

$$P_{MAX} = (V_{IN(MAX)} - V_{OUT}) \times I_{OUT}$$

Where: $V_{IN(MAX)}$ = maximum input voltage

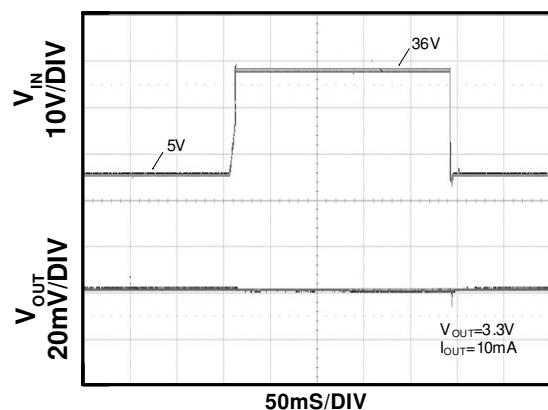

P_{MAX} = maximum power dissipation of the package
