

■ General Description

The AME8907 is an ultra-small linear regulator(LDO) featuring ultra-low quiescent current and low dropout that is able to source 350mA with excellent transient performance.

The AME8907's ultra-low I_Q ($1.3\mu A$) is designed specifically for the applications requiring extreme low quiescent current. This LDO could increase battery life through maintaining low I_Q consumption even in drop-out mode.

The feature of $1.3\mu A$ low quiescent current and $0.1\mu A$ shutdown current are ideal for the battery application with long service life. The other features include current limit function, over temperature protection and output discharge function.

Package available in SOT-25, DFN-4A($1 \times 1 \times 0.4\text{mm}$) and DFN-6D ($2 \times 2 \times 0.75\text{mm}$).

■ Features

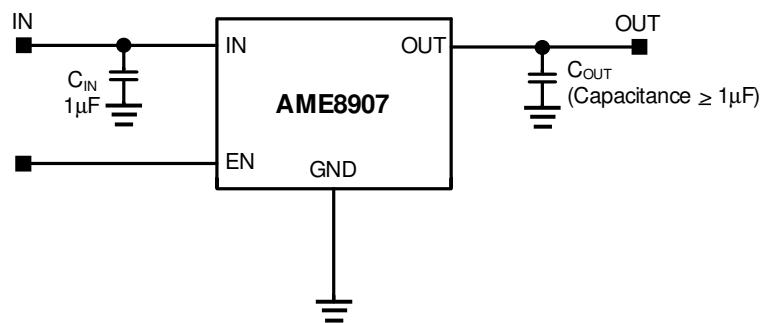

- Input Voltage Range: 1.2V to 5.5V
- Output Voltage Range:
 - Fixed Version_from 0.8V to 4.5V
 - ADJ Version_from 0.8V to 5.0V
- Output Voltage Tolerance: $\pm 1\%$
- Dropout Voltage: $150\text{mV}(\text{typ}) @350\text{mA}, V_{\text{OUT}}=2.5\text{V}$
- Low Quiescent Current: $1.3\mu A$
- High PSRR: $80\text{dB} @1\text{kHz}$
- Output Noise: $25\mu \text{VRms}$
- Over Temperature Protection
- Over Current Protection
- Output Active Discharge Function

■ Applications

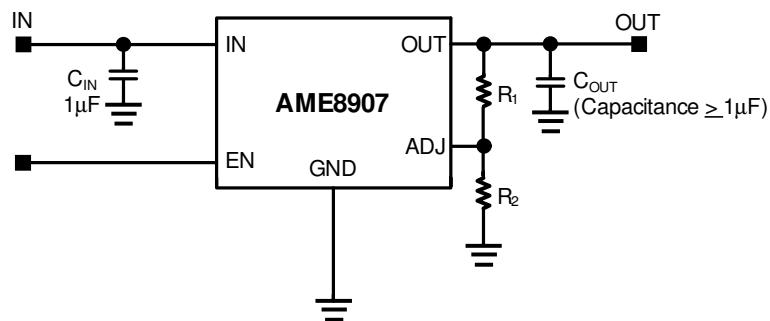

- Portable Device, Tablet and Smartphone
- Camera, VCR and Car Dashboard Camera
- Cam Application Required Low Noise and Illuminance
- Communications and Infrastructure
- AR and VR Application
- FA Equipment, Smart Meter

Over Temperature Hysteresis	OTH	$I_{OUT} = 1mA$		30		$^\circ C$

■ Detailed Description

Overview

The AME8907 is a low dropout linear regulator (LDO) featuring low quiescent current with excellent line and load transient performance designated for power-sensitive applications. The 1% accuracy of output voltage provides low output noise, high power supply rejection ratio(PSRR) and low-dropout voltage.

Enable Pin

Enable pin is powered-on in Active-High mode. During pulled-low mode, the MOS transistor is off and all of internal circuits are powered down. When the EN pin is floating, the internal mode is pulled-down.

Adjustable Version

The output voltage of regulator is determined by external resistor dividers. While external resistor divider is connected to ADJ pin, the output voltage is calculated by the following equation:

$$V_{OUT} = V_{ADJ} \times \left(1 + \frac{R_1}{R_2}\right)$$

For AME8907, the range of output voltage is from 0.8V to 5V.

R1 and R2 should be high enough to maintain low quiescent current but the exceeding value of R1+R2 will reduce stability. In general, when R1 and R2 are above 10KΩ, LDO will reach adequate stability and generate reasonable layout precautions. To improve stability, keep parasitics on the ADJ pin to a minimum and lower R1 and R2 values.

Under-Voltage Lockout(UVLO)

UVLO keeps the output shutdown until the internal circuitry is operating properly.

Input and Output Capacitor Selection

AME8907 is designed to stabilize a wide range of output capacitors. The ESR of output capacitor relates to stability. The larger ESR of output capacitor decreases the peak deviations and improves transient response during current changes.

The different types of capacitor(aluminum, ceramic and tantalum) have different characterizations, such as temperature and voltage coefficients. All of ceramic capacitors are manufactured with a variety of dielectrics, each with different behavior across temperature and applications. Common dielectrics are X5R, X7R and Y5V. It is recommended to use 1μF to 10μF X5R or X7R dielectric ceramic capacitors with 30mΩ to 50mΩ ESR range between device outputs and ground for stability. The AME8907 is designed to remain stable through ceramic capacitors with low ESR and larger capacitance. The ESR of output capacitor is very important because it generates a zero to provide phase lead for loop stability.

There is no requirement for the ESR on the input capacitor but its voltage and temperature coefficient must be considered for the environment of device application.

Auto Discharge

The auto discharge function could quickly force the output voltage to zero. When the LDO is disabled, the output capacitor is quickly discharged to reduce the output voltage to nearly zero. This function is very useful for the applications with quick ON/OFF function.

■ Detailed Description (Contd.)

Thermal Consideration

The power handling capability of device will be limited by allowable operating junction temperature(125°C). The maximum output power of AME8907 is limited by the maximum power dissipation of each package. The calculation of power dissipation is according to input voltage, output voltage and output current. The maximum power dissipation should not exceed the package's maximum power rating.

$$P_{MAX} = (V_{IN-MAX} - V_{OUT}) \times I_{OUT}$$

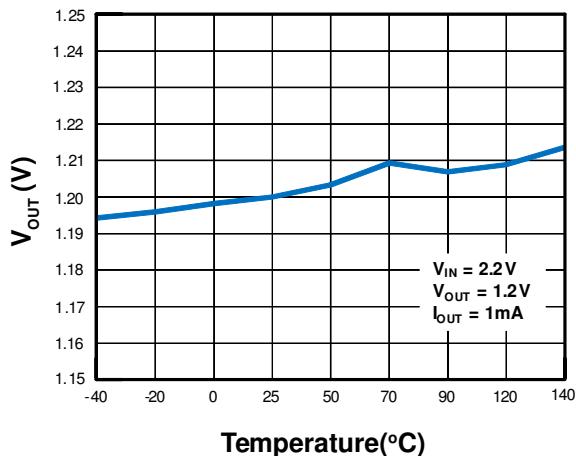

Where:

V_{IN-MAX} = maximum input voltage

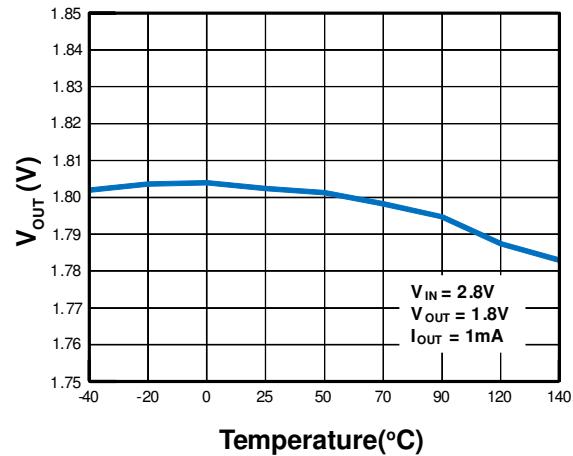

P_{MAX} = maximum power dissipation of the package
